Software Engineer Intern @ Morningstar · Full-Stack · Python · AWS · RAG & LLM Systems

Education

University of Illinois at Chicago Chicago, IL
Bachelor of Science in Data Science, Computer Science Concentration. *Expected May 2028*
Minor in Management Information Systems.

Experience

Software Engineer Intern March 2026 - Present
Morningstar Inc. *Chicago, IL*

- Owned the production v2 rewrite of the team's AI rule builder, converting analysts' plain-English data-quality rules into executable rule configs through a five-stage pipeline in which the LLM only proposes structure, gated by verbatim evidence grounding, registry type-checks, deterministic compilation, and human resolution of ambiguous datapoints.
- Built its evaluation harness, grading LLM output by semantic equivalence to a hand-parsed ground truth and requiring refusal on underspecified prompts, plus per-call cost accounting and SSM-backed secrets handling.
- Architected auto-scaling AWS infrastructure using Python, AWS CDK, and ALBFargateService for a full-stack RAG chatbot, integrating DynamoDB for real-time user sessions and low-latency LLM context retrieval.
- Developed UI features for Illume 2.0, a modular RAG document extraction platform serving 2,000+ non-technical users across 5 global offices, building REST API endpoints to retrieve, trigger, and post pipeline data to S3 and DynamoDB.
- Slashed data-collection turnaround from a ~5-week JSON build-and-test cycle to under a minute by replacing manual configuration with UI-driven pipeline setup across 1,000+ financial documents per workflow.
- Co-developed a proposed investment quality metric and built its prototype implementation, presenting to the CEO, CTO, and senior leadership; now in company-wide research for implementation.
- Engineered the core logic for a regression testing suite using AWS CDK and SQS to batch-queue pipeline runs, computing recall and F1 scores across variants to drive improvements.
- Created, modified, and debugged Harness CI/CD pipelines deploying to Kubernetes for staging and production releases; built a New Relic performance dashboard for Illume Studio (p50/p95 page load, API latency and failure rate, JS errors).

Lead Summer Robotics Programming Intern June 2025 - July 2025
CPS Office of Computer Science *Chicago, IL*

- Directed a high school robotics internship, assigning 17 students to tasks optimizing FRC and FTC robot performance.

Summer Robotics Programming Intern June 2023 - July 2024
CPS Office of Computer Science *Chicago, IL*

- Built Java software using the WPILib framework for an autonomous swerve drive FRC robot.
- Constructed a neural network from scratch in Python.

Projects

Fitch Revenue Segment Extraction Platform January 2026 - May 2026

- Engineered a retrieval-augmented segment extraction system that parses annual report PDFs, ranks revenue-relevant pages, sends structured context to an LLM, and validates extracted rows against strict Python schemas before analyst review.
- Designed the pipeline for single-document processing with horizontal scalability via ECS Fargate task parallelism, supporting CSV/XLSX/JSON export with approval-gated review.
- Partnered with three finance students to scope reporting requirements and presented the solution to company representatives.

Fully Autonomous FRC Robot August 2022 - May 2024

- Trained a PyTorch reinforcement learning model for autonomous robot navigation, achieving a sub-2 second intake average.
- Engineered a custom OpenAI Gymnasium environment to simulate robot dynamics and sensor data for agent training.

Activities & Leadership

High School FRC Programming Team August 2022 - June 2025
Team Lead and Mentor

- Mentored 12 programmers on project protocols and best practices, managing code contributions through Git and in-person reviews. Developed simulations for fully autonomous and semi-autonomous FRC swerve drive systems.

Skills

Languages: Python, TypeScript, Java, C/C++, C#, Lua
Frameworks and Libraries: AWS CDK, PyTorch, TensorFlow, OpenCV, WPILib
Cloud and Infrastructure: AWS, DynamoDB, S3, SQS, ECS, ECR, ALB, Kubernetes
Tools: Git, Jira, Bitbucket, Harness, New Relic, Postman
Architectures and Methodologies: REST API, RAG, Agile (Scrum)
